ABOUT ME

Alexander Mylchenko, javascript full-stack web/software & mobile engineer with commercial development experience since 2005. My core focus and strength lie in building software products from scratch, including architectural design and full-stack implementation. I have hands-on end-to-end development experience and am capable of independently driving a project from technical concept to production release. At the same time, I am most effective within a team model where client communication and requirement management are handled by a project manager or analyst. This approach helps prevent requirement distortion and allows me to fully concentrate on engineering tasks - architecture, implementation, and long-term technical stability of the solution.

I primarily work within Ukrainian engineering teams where clear professional communication and a shared working language are established. In team development, I consider having a unified technical and communication context essential, as it positively impacts solution quality, development speed, and predictability of results.

I work comfortably both independently and as part of structured teams with clearly defined roles and processes. I prefer collaboration models where the company acts as the fully responsible party of the project, ensuring coordination, process support, and accountability for results, rather than shifting managerial or client-facing responsibilities onto developers.

With long-term and continuous experience, I have a broad understanding of web development, modern and well-established technologies, and common architectural approaches. I prefer a pragmatic engineering mindset without unnecessary complexity, focusing on quality, maintainability, and sustainable product evolution.

CORE ENGINEERING FOCUS

Engineering activities focus on building applied systems where business logic, architecture, and infrastructure form a coherent and manageable structure. In development, the key is not only the implementation of functionality but also the resilience of the product model when requirements expand or change.

Practical experience includes designing and implementing web, mobile, and enterprise solutions in various domains: fintech and banking systems, streaming platforms, security systems, logistics, SaaS

products, and corporate administrative services. Work involves solutions that require high stability, access control, action auditing, real-time data processing, and integration with external services.

Depending on the tasks, both modular monolithic architectures and microservice approaches were applied. Using Domain-Driven Design, CQRS, and event-driven principles allowed structuring the domain model, reducing component coupling, and managing system evolution without compromising its internal integrity.

Experience includes building systems with access control, session management, audit logging, integration of security verification mechanisms, and interaction with external APIs. Priority is given to predictable system behavior, controlled changes, and engineering discipline when scaling.

The development approach is based on pragmatism and responsibility for the long-term state of the product: each architectural decision is evaluated in terms of its impact on the future evolution of the system.

EDUCATION

My formal education is outside the technical field. I consciously chose professional development in software engineering, as software system development became my primary area of professional realization and has remained one of my key fields of interest for many years.

My engineering foundation was built through early exposure to programming and many years of hands-on practice. My development journey began in the late 1980s on a ZX-Spectrum 48K computer (Basic). During my school years, my interest strengthened on IBM-compatible computers and with the Borland Turbo Pascal language (Graph/Turbo Vision), which expanded my capabilities in algorithms, data structures, and application design principles.

With the beginning of the Windows era, I actively developed solutions using Borland Delphi, creating client-server systems (Interbase/Firebird) and commercial products during the formative period of the IT market in Ukraine. This stage shaped my systems thinking, architectural mindset, and understanding of the full development lifecycle.

LANGUAGES

ukrainian	Spoken and written communication
russian	Fluent proficiency, spoken and written communication
english	Technical reading and written communication (working proficiency)

Primary languages of direct communication are Ukrainian and/or russian. Within a team, I adhere to the principle of efficiency and speed of interaction without ideological or formal constraints. I work within an engineering model with clear role separation: the developer is responsible for architecture and implementation, while interaction with external stakeholders is handled through designated managerial roles. I am oriented toward Ukrainian engineering teams with established processes and professional structure.

SKILLS

programming languages	JavaScript/TypeScript, Java

front-end	ReactJS (SSR/CSR), NextJS, Redux, Flux, React Hooks, Context API, React Router, React-Native, Expo.IO, jQuery, Bootstrap, Ant Design, Material UI, CSS, SCSS, Stylus, Jade/Pug, Webpack, Babel, Gulp, AJAX
back-end	NodeJS, ExpressJS, Spring Boot, Laravel, GraphQL, REST API, WebSockets, Axon Framework / Server, Middleware Architecture, API Design, Authentication & Authorization, JWT, OAuth2, Session Management, ACL/RBAC, Audit Logging, Security Engineering, Validators, ImageMagick, Wowza Streaming Engine, Adobe Flash Media Server, Google API, Google Maps / Geolocation API, Telegram API, Facebook API, VK API
architecture & engineering practices	Domain-Driven Design (DDD), CQRS, Event Sourcing, Clean Architecture, Hexagonal Architecture, Layered Architecture, Microservices Architecture, Event-Driven Architecture, SOLID Principles, System Architecture Design, Full-cycle Product Development, Legacy System Modernization, Refactoring, Performance Optimization, Integration Architecture, Technical Documentation, Sprint-based Development (Agile), Team Leadership, Monorepo / Multi-repo Strategy, Real-time Systems, Media Streaming Architecture, Video Processing Pipelines
databases	MySQL, MariaDB, PostgreSQL, MongoDB, SQLite, Redis, InterBase/Firebird
infrastructure & delivery	Docker, AWS S3, CDN, CI/CD, Linux, Nginx, Environment Configuration (.env), Reverse Proxy, Gateway, CORS Configuration, App Store Release Management, Google Play Release Management

CONTACTS

contacts	Email, Telegram
social	LinkedIn
hobby	Bandcamp, YouTube

EXPERIENCE: over 20+ year(s)

ARGUS SOFT

javascript/java | mobile developer | full-stack developer | teamleader

june 2022 - february 2026 (3 years 9 months)

full-time remote

Work was carried out as part of a Ukrainian engineering team delivering projects for Ukrainian and European markets. Requirements were defined by project managers in collaboration with clients and transferred into development via Jira and Confluence.

At the initial stage, the primary focus was full-stack JavaScript development covering mobile, frontend, and backend layers. As project complexity increased, the area of responsibility gradually expanded toward system design and architectural decision-making.

The key long-term project was a premium passenger transportation platform. Mobile applications for iOS and Android were developed with complex UI, animations, geolocation, maps, background processes, and real-time interaction. In parallel, a web-based administrative panel was implemented for operational management with maps, geocoding, live data updates, and release preparation for the App Store and Google Play.

Additionally, multiple corporate web platforms and administrative panels were delivered across various business domains, including multilingual websites, content management systems, dynamic data loading without code changes, server-side logic, and database integrations.

At a later stage, long-term outstaff work was performed in the banking domain with a focus on technical leadership and solutions beyond JavaScript. An official communication and document exchange system was developed and integrated into the remote banking interface, including antivirus verification, qualified electronic signature (QES), access control, session management, and audit logging. In parallel, together with a business analyst, a legacy core system was modernized with the implementation of a universal Domain-Driven Design core based on Java technologies.

technical stack (used by me): java, javascript, typescript, react.js, redux, expo.io, react.native, ssr/csr, node.js, express.js, next.js, telegram api, spring boot framework, axon server/framework, cqrs, event sourcing, domain-driven design, oracle, mysql, mariadb, mongodb, redis, websockets, docker, google api, scss, ant.design

CART2CART

javascript | front-end developer

november 2021 - june 2022 (8 months)

part-time remote

Worked on a complete rewrite of the client-side part of the product from scratch. The main goal of the project was migrating the existing front-end solution from jQuery to a modern stack using React.

Within the project, the client-side application was developed in parallel with the new server-side implementation. To isolate front-end development and maintain development speed, mock data was used instead of real APIs. This approach made it possible to fully implement user flows, interaction logic, and interfaces independently of back-end readiness.

The application architecture was designed, core screens and components were implemented, and a color scheme editor was introduced to enable flexible UI customization. Special attention was paid to code structure, component reusability, and preparing the front-end for further integration with server-side logic.

technical stack (used by me): javascript, redux, react.js, jquery, ant.design, scss, webpack, babel

LÖFFLER SECURITY SYSTEMS

javascript | mobile developer

september 2021 - april 2023 (1 year 8 months)

part-time remote

Participated in the development of a specialized software solution for monitoring protected natural areas. The project focused on ensuring visitor safety and preventing unauthorized presence within reserve territories.

The main task was developing a mobile application for a flying drone running on the Android operating system. The application was implemented using React Native and served as both the control and monitoring interface for the drone.

The application functionality included working with the drone's video stream and processing visual data to recognize QR codes placed on visitors' clothing. QR code scanning enabled identification of individuals authorized to stay in the reserve, as well as detection of unauthorized persons and potentially dangerous situations.

The work was carried out within defined project requirements and technical constraints. The part-time format involved autonomous task execution, team interaction, and a strong focus on system reliability and stability under real operating conditions.

technical stack (used by me): javascript, typescript, expo.io, react.native, google maps/geolocation api

ROCKETECH SOFTWARE DEVELOPMENT

javascript | full-stack developer

december 2018 - july 2021 (2 years 8 months)

part-time remote

Worked for nearly three years as a full-stack developer in close collaboration with a project manager. Around six commercial projects across various business domains were delivered in this format. The project manager handled client communication and requirement definition, while I was responsible for technical implementation, architecture, and development.

The first project was the corporate Rocketech website implemented based on custom design layouts. Later, several product solutions were delivered, including BookWa - a social network for book enthusiasts, and Smart Building - a security system for construction sites featuring video surveillance, employee monitoring, and real-time access control.

Within the Alker project, a backend, REST API, and administrative panel were developed for a mobile language-learning application. The system supported dynamic handling of multiple languages, dictionaries, and learning mechanics, including both free and subscription models. The client-side iOS application was developed by a separate Swift developer.

Also participated in building PocketSafe - an iOS password manager (backend and API), and Talk Guard - a corporate telephony solution based on analog PBX systems.

Across all projects, I was responsible for server-side development, REST APIs, administrative interfaces, technical documentation, and integration with client applications. Work was organized in Jira, in short sprints, within small, well-structured teams including designers and mobile developers.

technical stack (used by me): javascript, react.js, redux, scss, node.js, next.js, ssr/csr, graphql, websockets, ant.design, material.ui, mariadb/mysql, amazon web services/s3, cdn service(s), google geo api, google maps api

OPPORTY

javascript | full-stack developer | teamleader

june 2018 - september 2018 (4 months)

full-time office

Worked as a Team Lead of a small IT department responsible for maintaining and developing the Opporty.com portal. Two developers reported directly to me; additional specialists were involved when necessary for mobile-related tasks.

Responsibilities included gathering and initial analysis of business requirements. The product had a dedicated owner who defined tasks for the IT department; I was responsible for decomposing them, planning, and distributing work among team members. In parallel, I actively participated in implementation as a full-stack developer.

The primary focus was on maintaining and enhancing existing portal functionality, ensuring system stability, and implementing improvements aligned with current business needs. Work was carried out within a small team with clearly defined responsibilities and established internal processes.

technical stack (used by me): javascript, react.js, redux, material.ui, node.js, express.js, css, postgresql

ISRAEL NATIONAL TELEVISION

javascript | full-stack developer

february 2018 - june 2018 (5 months)

part-time remote

Participated in the development of a media portal as an additional developer within a small team. The project aimed at aggregating and organizing video content for further publication on a media platform.

The main area of responsibility was developing video providers to integrate various streaming platforms within a unified resource. Implemented logic for retrieving video data from external sources, structuring it, and preparing it for display within the portal interface.

System functionality included searching for popular national TV shows and series, building a personal content repository, creating convenient playlists, and publishing materials into media portal catalogs. The main focus was on integrations, streaming stability, and proper handling of various broadcast sources.

technical stack (used by me): javascript, node.js, express.js, mongodb, vue, vuetify

YOGA 23 (Y23) ODESSA

full-stack developer | teamleader

august 2013 - october 2017 (4 years 3 months)

part-time remote

Worked within an association of instructors of a methodological training system that united a network of sports studios and instructors. Responsible for technical development and maintenance of the organization's web services, including online platforms, informational resources, and digital event support.

Responsibilities included development and maintenance of web applications, integration of internal services, implementation of user interfaces and server-side logic, as well as ensuring stable operation of systems related to scheduling, registrations, and participant interaction. Participated in technical support of events, retreats, and educational activities, providing digital infrastructure for their execution.

The role combined engineering tasks and technical leadership: making architectural decisions, selecting technologies, coordinating development, and maintaining existing services. The main focus was on system stability, user experience convenience, and development of the organization’s online ecosystem.

technical stack (used by me): javascript, react.js, redux, ant.design, css, react.native, php, laravel, google api, facebook api, vk api, webpack

OSSYSTEM

javascript | full-stack developer | teamleader

june 2017 - march 2018 (10 months)

full-time office

Worked as a full-stack developer in a project aimed at building a legal document processing system. The primary task was developing document handling functionality, including server-

side file processing and a user interface for detailed document analysis. Users could upload documents in popular formats, after which pages were automatically converted into images (.png/.jpg) for further work.

A specialized UI editor was implemented, allowing users to select specific areas of document pages and discuss their content between lawyer and client directly within the selected region. Within the project, I was responsible for both front-end and back-end development, including document processing logic and interface interaction.

In parallel, I performed the role of Team Lead for a team of junior developers. Responsibilities included mentoring, quality control of implementations, and supervising development of the municipal web portal for the city of Chornomorsk. The primary focus was on maintaining technical standards, supporting architectural decisions, and developing team skills.

technical stack (used by me): javascript, react.js, redux, flux, ant.design, material.ui, scss/css, webpack, node.js, image.magick

CISCO
full-stack developer
july 2016 - november 2016 (5 months)
full-time office

Performed refactoring and optimization of the ISE Portal Builder system (internal tools for working with the company's network infrastructure). The primary objective was improving performance and simplifying maintenance of the existing solution.

At the initial stage, conducted bottleneck analysis and focused on database optimization. By restructuring queries and introducing indexes for key fields, it was possible to significantly accelerate execution of core system scenarios. The achieved results fully satisfied project requirements, so no further deep architectural changes were necessary.

In parallel, participated in other internal company developments, handling tasks related to the evolution and support of corporate web applications within established processes and technical standards.

technical stack (used by me): javascript, react.js, reactive.js, jquery, backbone.js, angular.js, redux, coffee.script, ant.design, stylus, jade, php, laravel, gulp, webpack, mysql

CONTINUUMUA
full-stack | software developer
june 2011 - may 2016 (5 years)
full-time office

The primary area of responsibility was development and maintenance of a corporate web video player and participation in building a streaming platform for video content management. Worked on implementing client-side and server-side logic, integrating streaming video, and supporting media publishing tools.

Developed a web video editor tool for content managers that enabled cutting video fragments by keyframes and generating configurations for console processing via ffmpeg. The tool was used for content preparation and optimization of publishing workflows within the platform.

Additionally created RIA applications and utilities for preparing, editing, and publishing materials on the company's SaaS platform pages. The main focus was on streaming stability, usability of tools for content teams, and development of the internal media infrastructure.

technical stack (used by me): actionscript, adobe flash player, adobe flash media server, adobe flex, adobe air, flash builder, flash develop, javascript, ajax, jquery, bootstrap, css, node.js, mysql, mongodb, sqlite, java, wowza streaming engine, php

LLC SPECIAL CODE SERVICE
actionscript developer
september 2010 - june 2011 (10 months)
full-time office

Worked in a team developing interactive casual games and entertainment applications. Participated in creating a series of 2D games, implementing game logic, animations, and user interfaces using ActionScript.

Developed game mechanics and client-side architecture for projects in bingo, slot-style arcade, and card game genres. Paid special attention to performance, component reusability, and smooth gameplay. As part of team collaboration, contributed to more than ten game projects - from prototyping to release of production-ready versions.

This period shaped fundamental skills in client application optimization, game state management, and working with graphical assets.

technical stack (used by me): actionscript, adobe flash player, adobe flash professional, flash develop

FULL HOUSE LTD.
software developer
august 2008 - december 2008 (5 months)
full-time office

Worked at a system integrator company on maintenance and development of an inventory management system for warehouse infrastructure. The core business logic of the application was implemented at the Firebird database level, including stored procedures, triggers, and data processing.

Most tasks were related to development and support of server-side logic, optimization of data structures, and maintaining functionality through database administration tools (IB Expert). The client side of the system was a simple management interface implemented in Delphi, integrated at the database level.

The main focus was on stability of business processes, correctness of data processing, and further development of the existing system logic.

technical stack (used by me): borland delphi, interbase/firebird, ib expert

SEA&LAND CREW AGENCY
software developer
march 2007 - august 2008 (1 year 6 months)
full-time office

Worked at a maritime crewing company on development and maintenance of a client-server application for managing a seafarers database. The system was implemented in Delphi using Firebird Database and was designed to store and process professional information about ship crew members.

The application allowed maintaining personal records, employment history, documents, and technical specializations of seafarers, performing searches using complex filters, and generating structured candidate lists. Implemented export of profile forms into DOC and Excel formats via OLE integration, and embedded a reporting editor based on Fast Reports.

In addition to system development and maintenance, participated in the company's operational activities as an inspector, including preparation and organization of seafarers' deployment to voyages. The main focus was on business process automation and increasing efficiency of internal operations.

technical stack (used by me): borland delphi, fast reports, interbase/firebird, ib expert, ole, adobe flash player, actionscript, javascript, php, mysql

PE AUTOTRANSCONTAINER
software developer
january 2007 - january 2008 (1 year 1 month)
full-time office

Within a private collaboration, developed a logistics management and container operations accounting system. The solution provided automated calculations for Demurrage and Detention, tracking of daily currency exchange rates, and control of financial indicators related to container handling and usage periods.

The system enabled maintaining a container registry, tracking shipment statuses, calculating tariffs and delays, generating reports and summary data for operational decision-making. Development was carried out in close cooperation with company management, allowing functionality to be tailored to real business processes and industry specifics.

The main focus was on creating a convenient client-server tool that increased transparency of calculations and reduced the volume of manual operations in employees' daily work.

technical stack (used by me): borland delphi, fast reports, ole, interbase/firebird

STATE ENTERPRISE ODESA AVIATION PLANT / AVIRS
software developer
august 2005 - august 2006 (1 year 1 month)
part-time remote

Participated in the development of an internal information system for the quality control department of an aircraft repair enterprise. The solution was designed to automate internal audit processes, monitor execution of production tasks, and centrally manage working documentation.

The system provided analytical statistics on task completion, tracking of work statuses, generation and printing of production tickets, as well as editing of document templates. Development was carried out in close collaboration with the quality control department management, taking into account regulatory standards and industrial environment requirements.
